Education

University of Regina

2025

Bachelor of Science in Computer Science

Regina, Saskatchewan

Technical Skills

- C++, Python, JavaScript
- Data Structures
- React, Tailwind
- Web Development
- Microsoft Applications
- Data Transformation
- Software Methodology
- Computer Architecture

Experience

Data Analyst

September 2025 – Present

Sustainability Office, University of Regina

Regina, Saskatchewan

- Built a dashboard from the ground up using Microsoft Power BI to analyze the university's utility, environmental, and student demographic statistics, and monitor current progress towards the active Sustainability Action Plan.
- Transformed data from more than 200 files, establishing data standards and consolidating over 20 years of records into functional data formats.
- Developed a data pipeline using Power Query to automate the process of transforming, appending, and integrating new data into the dashboard without user involvement.

Coding Instructor, Centre Director

September 2022 – January 2025

Code Ninjas

Regina, Saskatchewan

- Delivered coding instruction to children aged 5-15 in multiple programming languages—including block-based tools, JavaScript, C#, and Lua.
- Taught structured lessons to classes of students of varying ages and skill levels, ensuring lesson content was accessible to each student while progressing the knowledge and experience of the class as a whole.
- Managed the technical and managerial operations of the Code Ninjas center, ensuring smooth and efficient functioning.

Projects

Automated Artificial Window | *ESP-32 Microcontroller, C++*

- Built and coded an ESP32-driven project that accurately simulates daylight shining through a window based on the current time and location.
- Instantiates an HTTP connection and retrieve the current time using a Network Time Protocol server and the present day's sun cycle data.
- Adjusts the brightness and color of the WS2812B LEDs based on the current time and location to precisely match the local sunlight.
- Optimized to minimize network and hardware utilization.

Sustainability Dashboard | *Power BI, Power Query, Excel, Python*

- Used Power Query to transform over 200 files and automate the addition of new data.
- Developed a robust data model to establish relationships between data without merging separate categorical spreadsheets.
- Built a dashboard using Power BI to visualize multiple categories of sustainability statistics. Implemented flexible user control to filter what data is displayed.
- Automated annual report calculations to streamline end-of-year operations.

Personal Portfolio Website | *React, Tailwind, HTML, CSS, JavaScript*

- Designed and built personal website from scratch, utilizing the React framework to develop a single-page application (SPA) with modular components, and styled it using the Tailwind CSS framework.
- Used React and JavaScript to develop a scalable portfolio storage system for organization and ease-of-use. Project, Model, and Article objects are stored in JSON files. Project cards and pages are automatically generated and dynamically displayed based on their content.
- Implemented a portfolio pagination system that handles multiple object types.
- Utilized Tailwind to display content accurately and pleasingly on any display size. Formatted the desktop and mobile webpages differently to provide an optimal user experience for each scenario.
